Attempt : 1
Total Mark : 30
Marks Obtained : 30

Section 1 : Coding

1. Problem Statement

Raj wants to write a program that takes a list of strings as input and returns the longest word in the list. If there are multiple words with the same length, the program should return the first one encountered.

Help Raj in his task.

Input Format

The input consists of a single line of space-separated strings.

Output Format

The output prints a string representing the longest word in the given list.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: cat dog elephant lion tiger giraffe

Output: elephant

Answer

```
# You are using Python
words=input().split()
longest=""
for word in words:
    if len(word)>len(longest):
        longest=word
print(longest)
```

Status : Correct

Marks : 10/10

2. Problem Statement

Sarah is a technical writer who is responsible for formatting two important documents. Both documents contain a certain placeholder character that needs to be replaced with another character before they can be finalized. To ensure consistency in formatting, Sarah wants you to help her write a program that processes both documents by replacing the placeholder character with the new one.

Sarah also prefers a neat and structured output, so she wants you to ensure that both modified documents are printed in a single line, separated by a space, using the `format()` function.

Example

Input:

Hello

World

o

a

Output:

Hella World

Explanation:

Here the character 'o' is replaced with 'a' in the concatenated string.

Input Format

The first line contains string1, the first document.

The second line contains string2, the second document.

The third line contains char1, the placeholder character that needs to be replaced.

The fourth line contains char2, the new character that will replace the placeholder.

Output Format

The output displays a single line containing the modified string1 and string2, separated by a space.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: Hello

World

o

a

Output: Hella World

Answer

```
# You are using Python
```

```
s1=input().strip()
```

```
s2=input().strip()
```

```
place=input().strip()
```

```
new=input().strip()
```

```
mod1=s1.replace(place,new)
mod2=s2.replace(place,new)
print(f"{mod1} {mod2}")
```

Status : Correct

Marks : 10/10

3. Problem Statement

You have two strings str1 and str2, both of equal length.

Write a Python program to concatenate the two strings such that the first character of str1 is followed by the first character of str2, the second character of str1 is followed by the second character of str2, and so on.

For example, if str1 is "abc" and str2 is "def", the output should be "adbecf".

Input Format

The input consists of two strings in each line.

Output Format

The output displays the concatenated string in the mentioned format.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: abc

def

Output: adbecf

Answer

```
# You are using Python
```

```
s1=input().strip()
```

```
s2=input().strip()
```

```
if len(s1)!=len(s2):
```

```
    printf("Error")
```

```
else:
```

```
result=[]  
for i in range(len(s1)):  
    result.append(s1[i])  
    result.append(s2[i])  
print("".join(result))
```
