REC_Python_Week 2_CY

Attempt : 1
Total Mark : 40
Marks Obtained : 40

Section 1 : Coding

1.   Problem Statement

John is tasked with configuring the lighting for a high-profile event, where different lighting modes affect the ambiance of the venue. He can choose from three distinct lighting modes, each requiring a specific adjustment to the initial light intensity:

Ambient Lighting (Mode 1): The intensity level is multiplied by 1.5.Stage Lighting (Mode 2): The intensity level is multiplied by 2.0.Spotlight (Mode 3): The intensity level is multiplied by 1.8.

In the event that an invalid mode is provided, the program should output an error message indicating the invalid selection.

Your task is to write a program that reads the selected lighting mode and the initial intensity level, applies the appropriate adjustment, and prints the

final intensity.

The first line of input is an integer n, representing the lighting mode.

The second line is a floating value m, representing the initial intensity level of the light.

Output Format

The output displays "Intensity: " followed by a float representing the adjusted intensity level, formatted to two decimal places, if the mode is valid.

If the mode is invalid, the output should display "Invalid".

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 1
10.0
Output: Intensity: 15.00

Answer

```python
# You are using Python
M=int(input())
intensity=float(input())
if M==1:
    i1=intensity*1.5
    print("Intensity: {:.2f}".format(i1))
elif M==2:
    i1=intensity*2.0
    print("Intensity: {:.2f}".format(i1))
elif M==3:
    i1=intensity*1.8
    print("Intensity: {:.2f}".format(i1))
else:
    print("Invalid")
```

2. Problem Statement

Taylor is tasked with a mathematical challenge that requires finding the smallest positive number divisible by all integers from 1 to n.

Help Taylor to determine the smallest positive number that is divisible by all integers from 1 to n. Make sure to employ the break statement to ensure efficiency in the program.

Input Format

The input consists of a single integer, n.

Output Format

The output displays the smallest positive number that is divisible by all integers from 1 to n.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 10
Output: 2520

Answer

```python
# You are using Python
import math
n=int(input())
if n==0:
   print(0)
else:
   lcm=1
   for i in range(1,n+1):
      lcm=lcm*i//math.gcd(lcm,i)
   print(lcm)
```

3.   Problem Statement

Nisha is a mathematics enthusiast, eager to explore the realm of twin prime numbers. The objective is to develop a program that enables the discovery and presentation of twin prime pairs.

The program should take an integer 'n' as input and generate 'n' pairs of twin primes, displaying the pairs with a difference of 2 between them.

Input Format

The input consists of a single integer, n.

Output Format

The output displays the 'n' pairs of twin primes, the pairs with a difference of 2 between them.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 5
Output: 3 5
5 7
11 13
17 19
29 31

Answer

```python
# You are using Python
n=int(input())
count=0
num=3
while count<n:
    prime1=2
    prime2=1
```

```python
    for i in range(2,num):
        if num%i==0:
            prime1=0
            break
    for j in range(2,num+2):
        if(num+2)%j==0:
            prime2=0
            break
    if prime1 and prime2:
        print(num,num+2)
        count=count+1
    num=num+2
```

Status : Correct   *Marks : 10/10*

4. Problem Statement

Students are allowed to work on our computer center machines only after entering the correct secret code. If the code is correct, the message "Logged In" is displayed. They are not allowed to log in to the machine until they enter the correct secret code.

Write a program to allow the student to work only if he/she enters the correct secret code.

Note: Here, secret code means the last three digits should be divisible by the first digit of the number.

Input Format

The input consists of an integer n, which represents the secret code.

Output Format

The output displays either "Logged In" or "Incorrect code" based on the given condition.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 2345
Output: Incorrect code

Answer

```python
# You are using Python
def secret_code(n):
    nstr=str(n)
    first=int(nstr[0])
    three=int(nstr[-3:])if len(nstr)>2 else int(nstr)
    if three%first==0:
        print("Logged In")
    else:
        print("Incorrect code")
n=int(input())
secret_code(n)
```

Status : Correct   *Marks : 10/10*
